There are three different types of rows in Effective Dating.

**Current Row** - The data row with the date closest to - but not greater than - the current (system) date. Only one row can be the current row.

**History Row** - Data rows that have effective dates earlier than the current data row. There can be more than one row.

**Future Row** - Data rows that have effective dates later than the system date. There can be more than one row.
